composition comprising the immunoconjugate, composition or the antibody defined above, or its epitope-binding fragment, and a pharmaceutical agent; (4) a diagnostic reagent comprising the antibody defined above, where the antibody or antibody fragment is labelled; (5) inhibiting the defined antibody or its epitope-binding fragment, immunoconjugate, or (pharmaceutical) composition; (6) determining whether a biological sample contains a myelogenous cancer cell; (7) an improved antibody or its epitope-binding fragment that specifically binds to CD13; (8) an isolated polymucleotide encoding the antibody or its epitope-binding fragment to polymucleotide encoding the antibody or its epitope-binding fragment to contain a myelogenous cancer cell; (7) an improved antibody or its epitope-binding fragment to contain antibody or its epitope-binding fragment to contain antibody defined above or its epitope-binding fragment to comprising the polymucleotide; (11) a host cell transformed with the recombinant vector; (12) producing an antibody or its epitope-binding fragment having the ability to bind CD3; and (13) cobtaining CD3; from a biological material. The anti-CD3 antibody has cytostatic activity. The antibody or its epitope-binding fragment, composition can be used for treating copiect having a cisease where CD3; is expressed such as myelodysplastic syndrome, acute myeloid leukaemia, chronic myeloid leukaemia or pro-myelocytic leukaemia. CT can also be used for inhibiting the growth of cells expressing CD3; and for in vivo imaging or as affinity purification agents. The present sequence represents the mouse anti-CD3 antibody My9-6 light chain. ö New antibodies that bind to CD33, useful for treating a disease associated with CD33 expression, such as myelodysplastic syndrome, acute 1 NIMLTQSPSSLAVSAGEKVTMSCKSSQSVFFSSSQKNYLAWYQQIPGQSPKLLIYWASTR 60 1 NIMLTQSPSSLAVSAGEKVTWSCKSSQSVFFSSSQKNYLAWYQQIPGQSPKLLIYWASTR 60 anti-CD33 antibody; epitope-binding fragment; complementarity-determining region; CDR; immunoconjugate; cytostatic; antibody; myelodyaplastic syndrome; acute myeloid leukaemia; chronic myeloid leukaemia; pro-myelocytic leukaemia; mouse; light chain. The present invention describes an isolated anti-UJ3 antibody or its epitope-binding fragment comprising: (a) at least one complementarity-determining region (CDR); or (b) at least heavy chain variable region comprising 3 CDRs, and at least one light chain variable region. Comprising 3 CDRs, and at least one light chain variable region, where the CDR has the ability to bind CD3. Also described: (1) an immunoconjugate comprising the antibody or its epitope-binding fragment and a drug or prodrug; (3) a pharmaceutical composition comprising the antibody or epitope-binding fragment and a drug or prodrug; (3) a pharmaceutical composition comprising the immunoconjugate, composition or the antibody or antibody fragment is labelled; (5) inhibiting the agent, where the antibody or antibody fragment is labelled; (5) inhibiting the cell agent of a cell expressing CD33 by contacting the cell with the above defined antibody or its epitope-binding fragment, (6) determining whether a biological sample contains a myelogenous cancer cell; (7) an improved antibody or its epitope-binding fragment that specifically binds to CD33; (8) an isolated polymucleotide encoding the antibody or its epitope-binding fragment; (10) an isolated polymucleotide encoding a light or heavy chain of the antibody defined above or its epitope-binding fragment that specifically binds to CD33; (8) an isolated bolymucleotide encoding a light or heavy chain of the antibody or its epitope-binding fragment; (10) an isolated bolymucleotide encoding a subject having a recombinant vector comprising the polymucleotide encoding a subject having a cycostatic activity. The antibody or its epitope-binding fragment having the ability to bind CD33; and composition can be used for treating a subject having a disease where CD31 is expressed, such as myeloid leukaemia, chronic myeloid leukaemia or processing CD3 antibody or its epitope-binding fragment a more constinant as a sequence represents a mouse anti-cD33 antibody or sequence, which is used in an example from the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                        The present invention relates to an antibody that competitively inhibits the immunospecific binding of a human SMS-1 specific monoclonal antibody (huSMS-1) to a SMS-1 target antigen. The invention is useful in the fields of cancer biology and immunotherapy, in particular for diagnosing and treating malignancies such as melanoma, breast cancer or hepatocallular carcinoma. The present sequence is the mouse anti-SMS-1 antibody light chain variable (VL) region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "Mature Mouse SMS-1 (mSMS-1) light chain variable region protein"

                                                                                                                                                                                                                                                                                                                                        The present invention relates to antibodies which are specific for the cancer associated antigen SMS-1. The antibodies are useful for assaying for SMS-1 antigen in a sample, which is useful for the prognosis or diagnosis of a neoplasm, e.g. melanoma, breast cancer, or hepatocellular carcinoma. The present sequence is a variable region of one such anti-SMS

                                                                                                                                                                                                                                                                                                           The present invention relates to a chimeric protein having a Flt3 ligand (FL) or its biologically active fragment and a proteinuous or peptidyl tumoricidal agent. The invention is useful for treating malignancy, neoplasm e.g. melanoma, breast cancer, hepatocellular carcinoma and as a vaccine for eliciting an immune response. The invention is also useful in gene therapy. The present sequence is the mouse SMS-1 (mSMS-1) light chain variable region protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              80
                                                                                                                                                                                New chimeric protein comprises an Flt3 ligand and a proteinuous or peptidyl tumoricidal agent, useful for treating malignancy or neoplasm, e.g. melanoma, breast cancer, or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New chimeric protein for preventing or treating neoplastic conditions, e.g. melanoma, breast cancer or hepatocellular carcinoma, comprises an

                                                          This invention relates to a novel chimeric protein comprising an Flt3 ligand, or its biological fragment, and a proteinuous or peptidyl tumoricidal agent. The invention may be useful for the production of compounds with a cytostatic activity or a vaccine. The composition and methods are useful for preventing or treating neoplastic conditions, as melanoma, breast cancer or hepatocellular carcinoma. The present sequence is that of a protein which is related to the chimeric proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antibody engineering; chimeric antibody; cytostatic; gene therapy; vaccine; gastrointestinal disease; immune response; melanoma; malignancy; breast cancer; hepatocellular carcinoma.

ligand, or its biological fragment, and a proteinuous or peptidyl tumoricidal agent. The invention may be useful for the production of compounds with a cytostatic activity or a vaccine. The composition and methods are useful for preventing or treating neoplastic conditions, as melanoma, breast cancer or hepatocellular carcinoma. The present equence is that of a protein which is related to the chimeric proteins of the invention. Note: Two sequences were allocated this SeqID number in the specification, the alternative sequence is shown on page 21.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antibody engineering; chimeric antibody; cytostatic; gene therapy; vaccine; gastrointestinal disease; immune response; melanoma; malignancy; breast cancer; hepatocellular carcinoma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                           The present invention relates to a chimeric protein having a Flt3 ligand (FL) or its biologically active fragment and a proteinuous or peptidyl tumoricidal agent. The invention is useful for treating malignancy, neoplasm e.g. melanoma, breast cancer, hepatocellular carcinoma and as a vaccine for eliciting an immune response. The invention is also useful in gene therapy. The present sequence is the SMS-1 chimeric antibody (ChSM) light chain protein.

This invention relates to a novel chimeric protein comprising an Flt3 ligand, or its biological fragment, and a proteinuous or peptidyl tumoricidal agent. The invention may be useful for the production of compounds with a cytostatic activity or a vaccine. The composition and methods are useful for preventing or treating neoplastic conditions, such
                                                                                                                                                                                                 as melanoma, breast cancer or hepatocellular carcinoma. The present sequence is that of a protein which is related to the chimeric proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Clumping factor A; ClfA; fibrinogen; fibrin; Clf40; Clf33; N3 protein; immunological; staphylococcal infection; impetigo; pneumonia; furuncle septic arthritis; sepsis; endocarditis; antibacterial; wound; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                   The present invention relates to a chimeric protein having a Flt3 ligand (FL) or its biologically active fragment and a proteinuous or peptidyl tumoricidal agent. The invention is useful for treating malignancy, neoplasm e.g. melanoma, breast cancer, hepatocellular carcinoma and as a vaccine for eliciting an immune response. The invention is also useful in gene therapy. The present sequence is the FL/FC/chSMFv fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       608
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                             New chimeric protein comprises an Flt3 ligand and a proteinuous or peptidyl tumoricidal agent, useful for treating malignancy or neoplasm, e.g. melanoma, breast cancer, or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New chimeric protein for preventing or treating neoplastic conditions, e.g. melanoma, breast cancer or hepatocellular carcinoma, comprises an

ö The invention relates to monoclonal antibody which binds the clumping factor A (CIfA) protein from Staphylococcus aureus. The anti-clfA monoclonal antibody is useful for treating or preventing S. aureus infection in a human or animal, and for inhibiting the binding of staphylococcal bacteria to fibrinogen or fibrin. The immunogenic fragment S. aureus CIfA) protein, or the S. aureus N3 protein is useful for inducing an immunological response in a human or animal. These staphylococcal infections include wound infections, sepsis, impetigo, furuncles, pneumonia, septic arthritis or endocarditis. The present sequence is Staphylococcus aureus CIfA specific monoclonal antibody 12-9VLA-1 (variable light sequence) protein infections, impetigo, furuncles, pneumonia, septic arthritis or sepsis in 9 1 NIMLTQSPSSLAVSAGEKVTMSCKSSQSVFPSSSQKNYLAWYQQIPGQSPKLLIYWASTR New antibodies capable of binding to human tissue factor and do not inhibit tissue factor mediated blood coagulation compared to a normal plasma control, useful for diagnosing, preventing or treating cancer, Gaps cytostatic; gene therapy; human tissue factor; antibody engineering; blood; coagulation; plasma; diagnosing; cancer. ```
tissue factor (TF), which does not inhibit tissue factor mediated blood coagulation compared to a normal plasma control and can initiate an Fc-mediated mechanism. The composition and methods are useful for diagnosing, preventing or treating cancer, such as non-small cell lung cancer, breast cancer, colon cancer or prostate cancer. These may also be used in screening for agents that may treat or prevent cancer. This sequence corresponds to the light chain variable region of an anti-human

of tumor metastasis and treatment methods using such molecules. The screening method of the invention involves administering several test substances to a non-human syngeneic immunocompetent animal model bearing to the livest tissue or bone metastasis optionally in presence of a primary tumor, determining the effects of these test substances on the primary tumor, determining the effects of the primary tumor and identifying a test substance inhibiting soft tissue growth or bone metastasis without adverse effect on the status of the primary tumor. The invention is useful in the diagnosis and treatment of breast cancer, cloractal cancer, liver and lung metastases, bone destruction and bone loss. The animal models of the present invention is useful to screen substances useful for the prophylaxis or treatment of soft tissue and/or bone metastases which may additionally be effective in treating the primary tumor. The present sequence is murine anti-TGF-beta antibody carriant with the prophylaxis and treatment of soft tissue and/or brimary tumor. The present sequence is murine anti-TGF-beta antibody protein. anti-transforming growth factor (TGF)-beta antibodies] for the treatment Length 116; Query Match 93.6%; Score 544; DB 9; Best Local Similarity 92.0%; Pred. [anti-transforming growth factor (TGP)-beta antibodies] for the treatment of tumor metastasis and treatment methods using such molecules. The screening method of the invention involves administering several test substances to a non-luman syngemeic immunocompetent animal model bearing at least one soft tissue or bone metastasis optionally in presence of a primary tumor, determining the effects of these test substances on the soft tissue or bone metastasis and growth of the primary tumor and identifying a test substance inhibiting soft tissue growth or bone metastasis without adverse effect on the status of the primary tumor. The invention is useful in the diagnosis and treatment of breast cancer, colorectal cancer, liver and lung metastasis, on the growth or and bone colorectal cancer, liver and lung metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      loss. The animal models of the present invention is useful to screen substances useful for the prophylaxis or treatment of soft tissue and/or bone metastusses which may additionally be effective in treating the primary tumor. The present sequence is humanized murine anti-transforming growth factor-beta (anti-TGF-beta) antibody (also refered as humanized monoclonal antibody 2G7) chimeric protein.
Screening compounds useful for treating tumor metastasis involves administering a test compound to non-human animal model bearing soft tissue/bone metastasis and identifying compound that inhibits soft tissue growth/bone metastasis.
                                                                                                                                                                                                                             present invention relates to the screening of candidate molecules

```
New anti- clumping factor A (ClfA) monoclonal antibody, useful for treating or preventing Staphylococcus aureus infection e.g. wound infections, impetigo, furuncles, pneumonia, septic arthritis or sepsis in a human or animal.
                                                                                                                                                                                                                                                                                                                                                   The invention relates to monoclonal antibody which binds the clumping factor A (ClfA) protein from Staphylococcus aureus. The anti-ClfA monoclonal antibody is useful for treating or preventing S. aureus infection in a human or animal, and for inhibiting the binding of staphylococcal bacteria to fibrinogen or fibrin. The immunogenic fragment S. aureus ClfA) protein, S. aureus (ClfA) protein, s. aureus (ClfA) protein, or the S. aureus N3 protein is useful for inducing an immunological response in a human or animal. These staphylococcal infections include wound infections, sepsis, impetigo, furunoles, pneumonia, septic arthritis or endocarditis. The antibody 13-2VLA-1 (variable light sequence) protein
                                                                                                      Domanski P, Patel P, Hall A;
                                                                                                                                                                                                                                                                                                                Claim 11; Page 34; 80pp; English.

PH1054

fight chain V region (clone 202.135) - mouse (fragment)
C;Species: Mus musculus (house mouse)
C;Date: 30-Sep-1993 #sequence\_revision 30-Sep-1993 #text\_change 21-Jan-2000
C;Accession: PH1054
R;Tillman, D.M.; Jou, N.T.; Hill, R.J.; Marion, T.N.
A;Tillman, D.M.; Jou, N.T.; Hill, R.J.; Marion, T.N.
A;Title: Both IgM and IgG anti-DNA antibodies are the products of clonally selective B A;Reference number: PH0971; MUID:92381444; PMID:1512540
A;Accession: PH1054
A;Accession: PH1054
A;Molequle type: mRNA.

A;Residues: 1-103 <TIL>
A;Cross-references: UNIPARC:UP10000176AAE
A;Experimental source: B cell, strain [NZB x NZW]F1
C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords: immunoglobulin
F;16-96/Domain: immunoglobulin homology <IMM>

Submittee, C; Gilbert, Data Library, January 1994 A;Pescription: Structural characterization of an (NZB X NZW)Fl mouse-derived IgM anti-DN A;Reference number: S41393 A;Accession: S41393 A;Status: preliminary A;Molecule type: mRNA A;Residues: 1-112 <MAR>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Figlibert, D.; Brand, S.; Margaritte, C.; Delpech, A.; Tron, F.

Submitted to the EMBL Data Library, March 1994
A;Description: An idiotype D23-bearing polyspecific, murine anti-DNA monoclonal antibody
A;Reference number: S42484
A;Accession: S43103
A;Accession: Spealmainary
A;Accession: Spealmainary
A;Molecule type: mRNA
A;Residues: 1-112 <GIL>

```
A Molecule type: mRNA

A; Residues: 1-133 < MARA.

B; Experimental source: strain BALB/c

A; Note: the amino-terminal four residues of the mature protein were directly sequenced

C; Comment: This chain was obtained from a monoclonal antibody against Pseudomonas aerugi.

C; Comment: This chain was obtained from a monoclonal in homology

C; Reywords: heterotetramer; immunoglobulin

C; Reywords: heterotetramer; immunoglobulin

B; 1-20/Domain: signal sequence #status predicted <SIG>

F; 21-133/Product: Ig kappa chain V region 6A4 #status experimental <IGV>

F; 36-116/Domain: immunoglobulin homology <IMM>

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Patent No. 6187287

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: LEUNG, Shui-on
APPLICANT: HANSEN, Hans
TITLE OF INVENTION: IMMUNOCONJUGATES AND HUMANIZED
TITLE OF INVENTION: ANTIBODIES SPECIFIC FOR B-CELL LYMPHOMA AND LEUKEMIA CELLS
NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
ADDRESSEE: FOLEY & Lardner
STREET: 3000 K Street, N.W., Suite 500
CITY: Weahington, D.C.
COUNTRY: USA
